Devin Crockrel

Full-Stack Web Developer | Business Applications & Integrations

Ohio, United States | Remote | Eastern Time
solevagabond.github.io | github.com/SoleVagabond

PROFILE

I build web applications, connect services and troubleshoot the systems people depend on. My background combines a family business, practical computer support and substantial independent software and home-server projects. I bring that experience to understanding requirements, improving interfaces and checking how a system behaves when something goes wrong.

BUSINESS & TECHNICAL EXPERIENCE

Inkjet Express | Family business

Business operations, commercial accounts & technical support | Founding through closure

- Worked across customer service, commercial accounts, purchasing, inventory and order tracking throughout the business's life.
- Helped customers identify compatible ink, toner and printer supplies and resolve product or service problems.
- Coordinated vendors, negotiated purchases, maintained business records and followed up on outstanding orders and supplier issues.
- Organized routes and competing tasks, prioritized urgent customer needs and explained practical technical solutions.

Independent computer support | Small paid jobs beginning in 2009

- Diagnosed hardware and software issues for family and friends; configured Windows, applications, printers and peripherals, and worked through basic connectivity problems.

SELECTED APPLICATION WORK

Self-directed projects, with public demos, source and case studies linked below.

Northline Workshop | JavaScript, Node.js, Netlify

A customer website and repair-management application for a fictional bicycle business. Demo | Source

- Connected intake, customer/bike records, estimates, scheduling, parts reservations, repair progress and collection.
- Made revised estimates require approval of the current price and scope; preserved earlier customer decisions and repair history.
- Separated public pages, protected staff records and an isolated visitor demo. Added internal notes, shared customer updates/photos, offline payment records and reports.
- Handled persistent records and conflicting updates; replaced unsupported repair-time assumptions with inspection-based estimates and explicit scheduling decisions.

APPLICATION WORK & TECHNICAL RANGE

Nationwide job discovery & application workspace

Next.js, Node.js, SQLite, Redis | Public case study

- Developed real employer-feed ingestion alongside search, filtering, private member workspaces, saved searches, comparison and application tracking.
- Normalized inconsistent records, handled duplicates and kept original posting dates distinct from later source observations and link checks.
- Added resumable imports and persistent request budgets so collection can continue across bounded runs without skipping unfinished work.
- Expanded the search toward nationwide U.S. use and improved relevance by addressing generic recruitment advertisements. Source and member data remain private; public hosting is pending.

SentinelNode | Python, SQLite

Runnable application, release & source

- Built scheduled HTTP checks, incident acknowledgement, investigation notes and recovery history for a single operator.
- Added webhook delivery retries, saved delivery records, exports and database backup/recovery. Improved setup and notification controls after reviewing confusing user flows.

StreamEasy | Private React / Express application

- Built media discovery/search, external API orchestration, a browser-local library and playback progress. Investigated frontend, backend and provider integration issues.

21 West Lounge | Website & content workflows

- Developed a multi-page venue website and content-management workflows; reviewed navigation and page content against distinct visitor needs.

SYSTEMS & SELF-HOSTING

Practical Linux, Raspberry Pi, home-server and CasaOS experience. Docker-based services, storage/NAS projects, local addresses and ports, and basic DNS/connectivity troubleshooting. Used Tailscale, Syncthing, AdGuard Home and Uptime Kuma; experimented with Ollama and Open WebUI.

DEVELOPMENT & DELIVERY

Application work: JavaScript, HTML/CSS, React, Next.js, Node.js, Express, Python.
Data: REST APIs, JSON, SQLite, SQL fundamentals, imports and data-quality checks.
Tools: Git/GitHub, Netlify, GitHub Actions project checks and environment configuration.
Verification: Browser journeys, responsive interfaces, automated checks and failure/recovery testing. Practical AI-assisted development with requirements review and validation against actual behavior.
